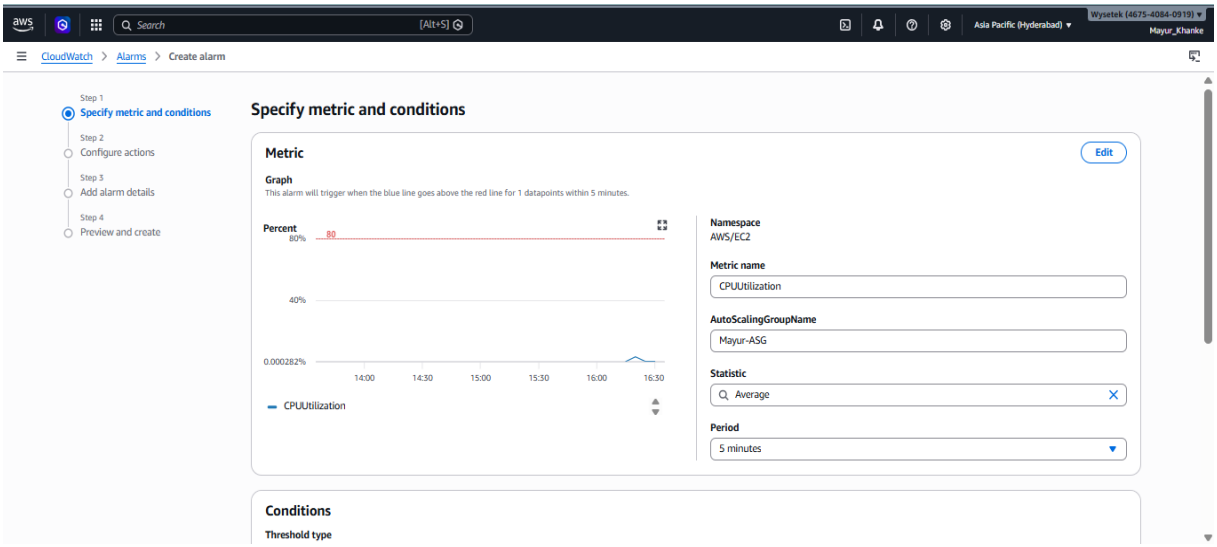
Observability

1) **Alarm on high CPU usage: -** Set up an Amazon CloudWatch alarm to trigger when CPU usage exceeds 80%, and configure it with an SNS topic to send SMS notifications to your phone when the alarm is activated.

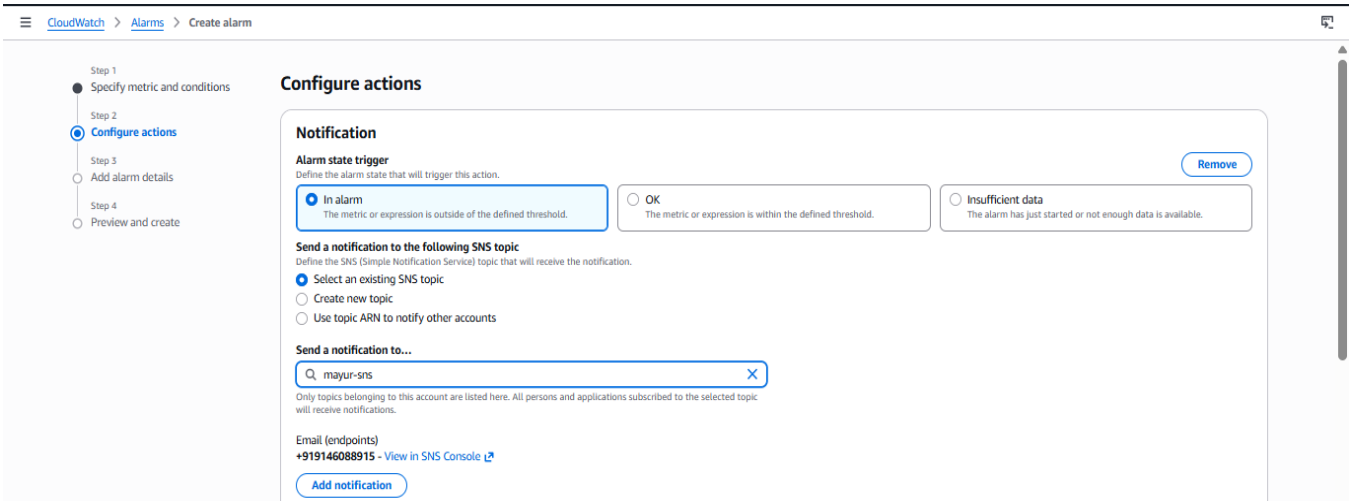
1) Select the **CPUUtilization** metric for your instance

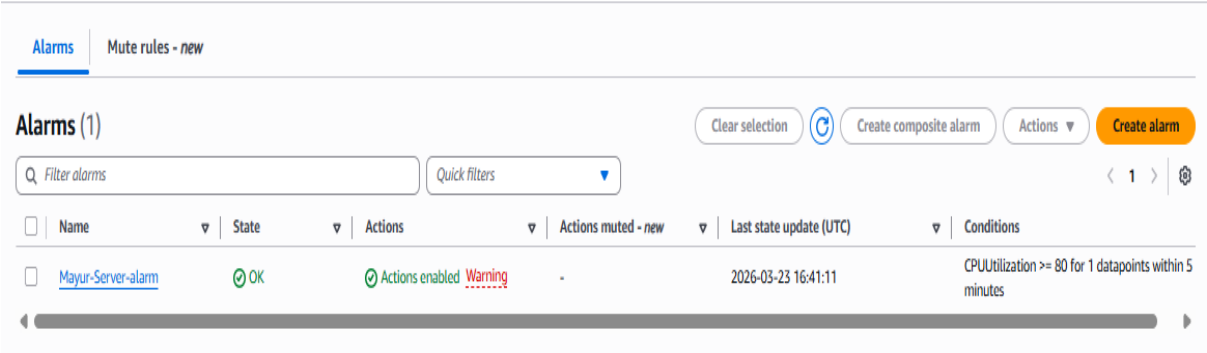
- Click **Select Metric**
- Configure the condition:

- Threshold type: Static
- Condition: **Greater than 80%**



2) Select an existing **SNS topic** or create a new one





2) **Alarm on instance unhealthy state: -** Set up an Amazon CloudWatch alarm to trigger when the StatusCheckFailed metric is greater than 0, and configure it with an SNS topic to send SMS notifications when the instance becomes unhealthy.

Steps to create the alarm

1. Go to the CloudWatch Console in AWS
2. Click on Alarms → Create Alarm
3. Select metric → Choose EC2 → Per-Instance Metrics
4. Select StatusCheckFailed for your instance
5. Configure the condition:
    - Threshold type: Static
    - Condition: Greater than 0
6. Click Next → Configure Actions
7. Choose or create an SNS topic
8. Add your phone number for SMS notifications
9. Click Next → Add Name & Description
10. Review and click Create Alarm
